

## Steps needed to install a new SQL Express Instance using MCv9 and PMCV9.

- **Run the Maintenance Coordinator 9 as an administrator** to grant the application access to make changes in your machine. (The user can run the application as administrator only when using the new SQL installation process)
- When using the MC9 for the 1st time you will be greeted with the DB connection window but if this is not the 1st time, the user can navigate to the DB connection window via **Admin > Databases > Setup Database Connections** on the main menu.

- Using the **Database > Install New SQL Express Instance** dropdown menu, the user will see a new window for the SQL Express Setup

- The user needs to select which SQL Express version to install (between SQL Express 2014, 2017, and 2019)
- After selecting an Instance version, the users are required to **enter a name for the instance** (Spaces are ignored when naming the instance)
- After naming the instance, the Install button will now be enabled, and the user can now start the installation process.
- It would take roughly about 5-10mins for the installation to complete.
